# Mixer cleaning with recycled water

Reduce fresh water use by up to 80%

**NEW**

**WALTER** 

# Less is more!

The innovative automated cleaning process for high concrete quality with low water consumption

With the innovation less dirty water is produced and on the other hand only little fresh water is needed for the automatic cleaning of mixers.

After all, a typical problem in the concrete industry is: the dirty water produced by the cleaning process is becoming increasingly difficult and cost-intensive to dispose of.

## 3 top advantages at a glance

- / savings of up to 80% fresh water
- / less dirty water
- / for new and existing systems

## The concept

The central element of the cleaning system is a high-pressure pump that can also use recycled water.

An intelligent control system decides in which processes recycled water can be used and then automatically flushes the cleaning system with fresh water.

The use of recycled and fresh water is automated and can be switched to manual operation if desired.

Likewise, the availability of recycled and fresh water is constantly checked to prevent the pump from running dry.

That's  
typical  
Walter!
